METHOD, SYSTEM, AND PROGRAM FOR
MAINTAINING A DATABASE OF DATA OBJECTS

ABSTRACT

Provided is a method, system, and program for maintaining a database of data

5   objects. A first data object implemented in a first programming language including

attributes and attribute values for a class is received. The first data object is transformed

to a second data object implemented in a second programming language, wherein the

second data object includes the attributes and attribute values of the class included in the

first data object. The second data object is added to the database, wherein the database is

10   capable of storing multiple data objects implemented in the second programming

language.
